

ABSTRACT OF THE DISCLOSURE

A phase-locked loop circuit provides an output signal having a frequency depending on the frequency of a reference signal. The circuit includes a feedback circuit that derives a feedback signal from the output signal, a phase frequency detector that provides a control signal indicative of a phase difference between the reference signal and the feedback signal, a control circuit that controls the frequency of the output signal according to the control signal, and a conditioning circuit that conditions the control signal through a conditioning signal. The conditioning circuit includes a storage circuit that stores energy provided by the control signal and the conditioning signal during a first phase and transfers the accumulated energy to the control circuit during a second phase.
